

Additives for Modern Vehicles

The application of additives may be helpful for a number of reasons.

Running-in: A new vehicle should be run-in first. Despite engine parts nowadays are very precisely manufactured, they have to “grind in” interactively. Amongst other functions LIQUI MOLY Cera Tec facilitates the running-in by supporting lubrication and preventing excessive wear during the “grinding-in” process.

Care: Once the engine has been run-in it shows its peak performance. But from now on wear and combustion residues are pressing hard, mile for mile, reducing performance, increasing fuel consumption and raising the risk of failures and repairs. So the aim should be right from the beginning to keep the engine as clean and wearless as possible. That's exactly what LIQUI MOLY's additives do.

Fuel quality: A high fuel quality is vital for modern motors. The fuel quality may vary from country to country, sometimes even from gas station to gas station. With inferior fuel the engine is not able to deliver its full performance, it flutters, the fuel does not burn properly, residues build up sedimentations within the engine and may cause damage.
